

Q-SWITCH TATTOO & BLEMISH REMOVAL POST CARE

You have had your Q-Switch Tattoo Removal or Skin Blemish treatment done today and this is to remind you of your post care responsibility for homecare of this treatment area.

- Q-Switch Yag Laser or IPL Laser Tattoo or Skin Blemish Removal results in a thermal skin injury - a delicate controlled burn wound.
- Expect the area to be sensitive, blistered and red for about a week after treatment. The darker and more recent the tattoo, the more likelihood there is for this result.
- The area will require post-operative wound care and requires application of an antibiotic ointment 3 times per day until the skin has healed because infection may lead to scar forming.
- Do not scratch, irritate or rub the treated area this will result in scarring. Do not pick or remove any of the scabs.
- If the Tattoo or Blemish is in an area where clothing could chafe against it, a non stick dressing should be applied until healing is complete.
- Keep the treated area clean and dry until it has completely healed.

Adhering to the homecare will help to have the best possible result in the treatment area
